

Coastal ecosystems and freshwater runoff

Jón Ólafsson (1,2) and Sólveig R. Ólafsdóttir (2), Department of Chemistry (1) and Marine Research Institute (2), Skúlagata 4, 121 Reykjavík. jon @hafro.is

The seasonal growth of marine phytoplankton is significantly different in coastal regions with freshwater influence compared with the open ocean offshore. This is a consequence of the freshwater influence on both physical processes and nutrient budgets of the coastal waters. The processes involved will be dealt with and other complex interactions in the coastal waters described with examples from investigations at Iceland.
